Personal Developer Productivity Tools

2019-03-03 BY GENE

It seems that *everyone* has a “Here’s my toolbox” write-up. So here’s mine (in abbreviated laundry-list form)!

ssh/scp – Is it possible to even live without these?

tmux – Screen management on steroids.

locate – Index and find files across your entire system.

vim – Raw editing power!

ack – Better than `grep -r` imho.

ctags – Index your source code.

tree – A recursive view into the filesystem.

curl – Command-line web access.

sqlite3 – Simple relational database.

postgresql – Powerful, relational database suitable for production.

perl, **cpanm** and **dzil**, etc. – My primary software development tools.

python and **ipython**, etc. – More than handy for too many reasons to list!

irssi – IRC is still better than web-based Slack-alikes.

git – Everyone needs a revision control system.

homebrew – My Mac package management system.
